Profilé MPT

Charges de flambage

Charges de flambage selon DIN EN 1993-1-1, paragraphes 6.2 et 6.3.

Les valeurs du tableau s'appliquent aux sections entièrement porteuses et à la répartition centrique de la charge!
Le degré d'élancement réduit possible pour le flambage par torsion et le déversement doit faire l'objet d'une étude particulière!

On considère le flambage sur les axes X et Y.

La charge de flambage la moins favorable est indiquée dans le tableau.

Le coefficient de sécurité $\gamma = 1,54$ tient compte des coefficients de sécurité et combinaison, ainsi que du coefficient de sécurité du matériau.

Définissez la longueur de flambage L_k déterminante en fonction des conditions et de la longueur du profil l (cf. figures ci-dessous).

Lire la charge de flambage F dans le tableau à partir de L_k .
